This patient tracking system is set up to be a web-based application that will allow for the clinicians and the patients family to track a patient's whereabouts in a hospital, as it updates in real time. The clinicians will also be able to update the patients admission status such as admit, discharge or remove completely. This will help with the clinician workflow by keeping an accurate record of the patient's history while admitted.

Key Features

- Add new patients with details such as name, MRN, DOB and Notes
- Edit and update existing patient information
- Discharge patients
- Delete patient records when no longer needed
- Search and filter by name, MRN or status

System Requirements

- Python 3.12
- Visual Studio Code 1.105
- Currently works on any web browser
