Introduction

This Patient Tracking System is designed to help the clinicians and visitors manage patient information efficiently. The administrators and staff will be able to edit, discharge and remove patients from their portal, using a simple web-based interface that will store the data there in the system.

Customer Problem Statement

Paper charting can cause delays in a busy hospital environment. The Patient Tracking System can solve this issue by providing an online interface for managing patients information. This system can also help the hospital administration staff maintain accurate records that will show registered, admitted and discharged patients.

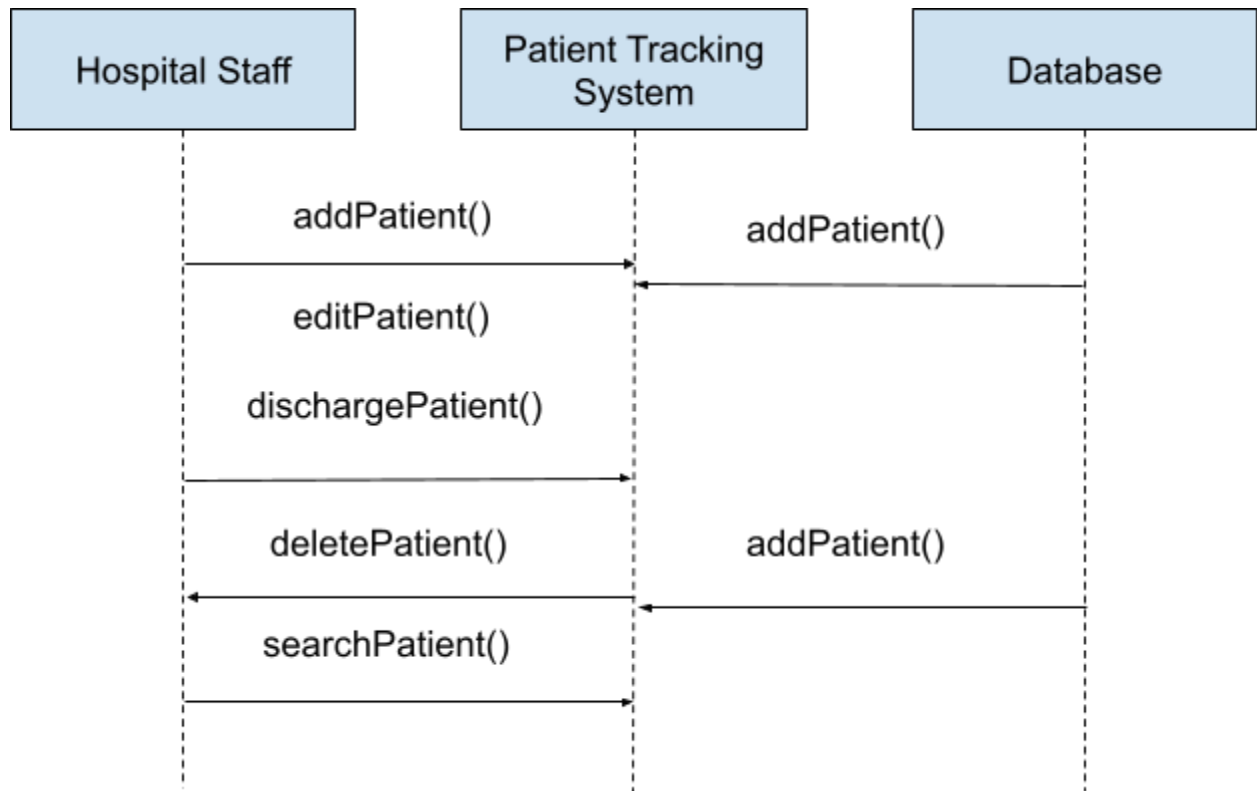

System Requirements

- Hardware Requirements
 - Windows, Linux or MacOS computer
 - Smartphone or Tablet
 - Internet browser (Chrome, Safari, Edge or Firefox)
 - 8 GB of RAM
- Software Requirements
 - Python 3.10 or higher
 - Visual Studio Code Editor
- User Requirements
 - Basic computer skills
 - Patient access
 - Staff access

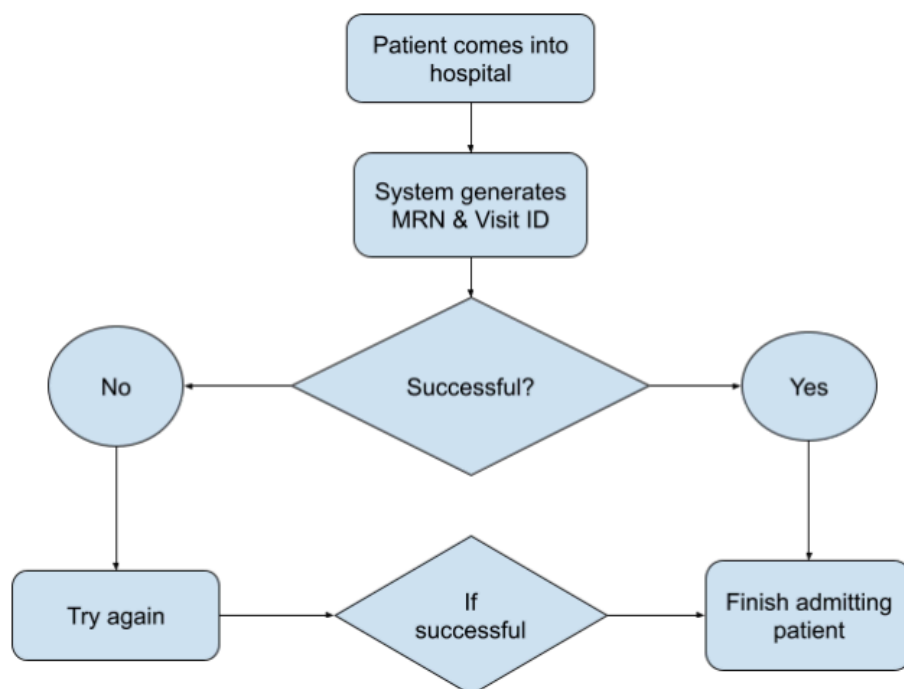

Functional Requirements

- Be able to Register, admit and discharge patients
- Edit the current patient status
- Chart vitals on the admitted patients
- Remove a patient completely from the system

SSD

Activity Diagram

User Interface Specification

- Main Dashboard
 - Table showing patients, MRN, Status and actions
- Search Bar
- Add/Edit Forms
 - You can enter or modify patient details here
- Buttons
 - Edit, Discharge or Delete options

Project Plan

Phase	Description	Status
Phase 1	Project planning & system design	Completed
Phase 2	Build Flask web app with database	Completed
Phase 3	UI testing & functional demo	Completed
Phase 4	Add authentication & reports (future work)	Upcoming
Phase 5	Final documentation & submission	In Progress
